

“When everything is just one click away, finding the right file can sometimes feel like searching for a needle in a digital haystack.”

“DIGITAL DISORGANIZATION AMONG STUDENTS”

Jan Dave P. Maloto
BSN 4-D

I. INTRODUCTION

The increasing use of digital technology in education has changed how students access, store, and manage academic information. While digital platforms provide convenience and allow students to easily access learning materials, the continuous accumulation of files, notes, messages, links, and other digital resources can make information difficult to organize and retrieve. This may lead to digital disorganization, characterized by difficulties in systematically managing and locating digital information. Research has shown that excessive digital information and digital distractions can interfere with students' focus, productivity, and academic performance (Alam et al., 2021; Deng et al., 2024; Choi & Yun, 2024). Moreover, recent research on digital hoarding among university students suggests that accumulating large amounts of digital files may make it more difficult and time-consuming to find needed information (Bravo & Valdés, 2025). Thus, understanding digital disorganization among students is important in identifying how difficulties in managing digital information may affect their academic routines and productivity.

II. DILEMMA

Despite the convenience of digital technology, students face increasing challenges in managing large amounts of digital information. Academic files, lecture materials, messages, and documents are often stored across different devices and platforms, making them difficult to organize and retrieve. Research suggests that the accumulation of digital content and information overload can contribute to difficulties in managing digital materials (Zaremohzzabieh et al., 2024; Liu & Liu, 2024).

The problem becomes more concerning when digital disorganization affects students' academic responsibilities. Excessive or poorly organized digital materials may consume time, reduce focus, and make important information difficult to locate. Recent research has also associated difficulties in managing digital content with academic burnout and poorer academic outcomes among university students (Bravo-Adasme et al., 2025). Digital distractions and multitasking may further affect students' academic focus and performance (Deng et al., 2024; Choi & Yun, 2024).

Despite these concerns, digital disorganization may be overlooked as a minor personal habit rather than an academic concern. Therefore, examining digital disorganization among students is important to understand how it may affect their academic productivity and management of digital resources.

III. SOLUTION

To address digital disorganization among students, StudyHub is proposed as a centralized academic organization platform designed to help students manage their digital schoolwork in one accessible space. Instead of keeping files, notes, schedules, and academic information scattered across different folders, applications, and devices, StudyHub provides students with an organized system where these resources can be grouped according to their subjects and academic needs.

StudyHub allows students to upload and categorize academic files, organize learning materials by subject, and keep important resources in designated sections for easier retrieval. It can also include task and deadline tracking, allowing students to record requirements, monitor upcoming deadlines, and prioritize tasks. A notes section can be used to store important class information, while a search function can help students quickly locate specific materials instead of manually checking multiple folders or applications.

The platform is designed to address common difficulties associated with digital disorganization by reducing scattered information and providing a more structured way of managing academic resources. By having important materials and academic tasks organized in one platform, students can spend less time searching for files and more time completing their schoolwork. StudyHub therefore aims to promote better digital organization, time management, productivity, and easier access to academic resources, providing students with a practical approach to managing the demands of digitally based learning.

IV. CONCLUSION

Digital disorganization is a common challenge among students as schoolwork increasingly depends on digital devices and platforms. While StudyHub can help students organize their files, notes, tasks, and deadlines, it cannot solve the problem by itself. An app can provide the tools, but it cannot force students to use them properly. In the end, the success of StudyHub depends on the students. If they do not update their files, check their tasks, or use its features, the platform will not make much difference. This shows that digital organization is not only about having the right tool, but also about having the discipline to use it. StudyHub can make organization easier, but students are still responsible for making the most out of it. The goal is not to make students depend on an app, but to help them build better habits in managing their schoolwork.
